

Mobile Data Computer

MDCs have been installed in all the vehicles for the deputies and the lieutenants. The computers allow access to the management information system at the sheriff's department and the TIME system to access driver and vehicle records.

The computers are equipped with wireless internet capabilities so the deputies can access information via the internet. The system allows them to exchange information silently during their shift and to enter data on calls, relieving some of the work load from the communications center. By viewing the screen, a deputy has a real-time picture of where each officer is currently assigned and who is available to respond to incoming calls.
